

Eureka Family Practice

PROJECT HIGHLIGHTS

This 10,000 square foot medical office building is a wood framed structure built in 1996. Due to the location of the building, the perimeter of the building and the parking area required extensive retaining walls, some as high as 18 feet. The floor consists primarily of wood framed truss joints and cripple walls off of the retaining walls which surround the back side of the building. There is a basement built in to a quarter of the building. The exterior of the building is a stucco "driveit" finish. The facility is currently occupied by several medical professionals. The building has a large waiting and administration area, with two clerical office areas at the entrance. The building comes complete with exam rooms and individual doctor offices.

PROJECT COST : \$878,337

PRESIDENT'S COMMENTARY

"Eureka Family Practice is a true example of Danco Builders' willingness to see a project through from design through construction. We use our expertise in the medical field to fast track the project through all phases. Knowing what the inspectors look for throughout the construction period is extremely beneficial to the owner and to us. Plan check and inspection are two areas where our experience pays off."
